Main design decisions **3**

Architecture plan **3**

1. Introduction

The need comes from an existing product, which is a camera system for vehicles. The need is for the user to be able to design the configurations for the inputs and outputs of the camera system and that the user could update new settings and software to the hardware. The main idea of the project is an application, which enables the user to update firmware to the hardware and to create a configuration of inputs and outputs as csv, which is used to create the actual update package for the end user. The application will be used mostly on laptop with different operating systems.

2. Main design decisions
